

EVALUATION CRITERIA FOR USER WORKFLOWS

(Internal quality calibration — never shown to user)

1. All scenarios have clear titles and descriptions following the proprietary syntax
2. User and Business Goals are concise, experience-oriented, not UI/feature-centric (1-2 lines each)
3. 2-4 workflow variations per scenario generated using WVD framework internally
4. WVD Dimension Applicability Check was executed internally (agent evaluated all 7 dimensions — never shown to user)
5. WVD dimensions, trigger questions, and applicability results do NOT appear in the output
6. Each variation title clearly communicates the structural difference
7. Variations share the same scenario, user goal, and business goal — only the structural path differs
8. No false variations (UI changes, performance, personalization, optional features, micro-interactions)
9. Flexible selection paths use branching logic within one workflow, not separate variations
10. All screens have sequential numbering with no gaps
11. Same screen reused across scenarios has the same number and name
12. Sub-screens are < 15% change from parent; > 15% = unique screen
13. Screen goals are consistent regardless of scenario context
14. Screen descriptions are comprehensive — all information and actions, no UI elements
15. Screen descriptions use DO/DON'T pattern (information and actions, never buttons/dropdowns/tables)
16. DPs use "HMW..." format, DOs use "What if..." format, RQs are questions
17. DPs/DOs/RQs only on screens where genuinely relevant — not forced
18. DPs more frequent than DOs — this is expected
19. Workflows include error states, recovery flows, and branching where applicable — not just happy paths
20. Non-linear flows used where appropriate (optional steps, conditional paths)
21. Screen count tallied per workflow variation independently
22. If personas available, screen goals and DPs reflect persona pain points (internal traceability)
23. If ecosystem map available, system objects appear in screen content (internal traceability)
24. No additional commentary before or after the workflow structure
25. Scenario descriptions don't mention UI steps or elements
26. User naming convention followed (first letter matches role)
